

HireAssist Architecture

GitHub: <https://github.com/your-org/HireAssist>

Summary:

HireAssist is a recruiter-facing mini hiring pipeline. Recruiters manage candidates across Applied, Screening, Offered, and Hired (plus Rejected), with an immutable `stage_events` audit trail. A single search box provides realtime fuzzy name/position hints and full natural-language search via a two-attempt LLM-to-SQL chain guarded by read-only `SELECT` validation.

Components:

- Frontend: React, Vite, Tailwind (Kanban board, candidate detail, search UI)
- Backend: FastAPI, SQLite (positions, candidates, `stage_events`, resumes)
- AI: OpenAI chat completions; schema-conditioned SQL generation; max 2 tries
- Eval: 20 NL queries in `eval/queries.json`; `run_eval.py`

Data highlights:

- `offered_flag` / `hired_flag` for 'offered but not hired' queries
- `rejected_at` and `current_stage = -1` for rejections
- Seed: 3+ job openings, fixed anchor dates for time-based eval

See `project_structure.md` and `README.md` in the repository for module layout and run steps.
